Group Project (40 marks)

TASKS

Your tasks are to:

1. Carefully read this document;
2. Form and structure your group, allocating roles and responsibilities to your members. **Make sure you communicate frequently and contribute significantly to your group work. If you have little contribution to your group project, your individual mark will be significantly lower than your group's mark (or even 0 mark if you have almost no contribution).**
3. Complete the development of a given software system (enclosed in this document). This should cover **all software development activities** from requirements elicitation and specification, design to implementation and testing. **Your design must be based on the b-c-e framework discussed in the subject.**
4. Choose an agile method (Scrum is highly commended) for your group to follow. Choose a tool which supports that methodology for your group to use. **Taiga <https://taiga.io/> for agile method is strongly recommended** (choose the public option which allows multiple team members).
5. Demonstrate the practice of test-driven development and Continuous Integration/Continuous Delivery (CI/CD) in your project.
6. Produce a report detailing the group's work.

SUBMISSION

1. Final deliverable (**35 marks**): **23rd May 2023**
 - Final report
 - A 15 minute recorded video of a live demo of your product
 - Source code
2. Final presentation (**5 marks**): **The last lab session**

All submission must be made to Moodle by one member of your group by the deadline.

GUIDELINES

1. The **final report** should cover at least the following:
 - A complete list of user stories.
 - For each user story, a list of complete tasks.
 - A complete and detailed design including UML **use case diagrams, use case descriptions, sequence diagrams, class diagrams, data persistence and user-interface aspects.**
 - Sufficient evidence (with **screenshots and detailed text description/explanation**) to demonstrate that your group has followed an agile methodology and has used a tool which supports the methodology

from the beginning to the end of the project. Note: **make sure that you record these evidence every week (e.g. screenshots of the product backlog, sprints, the work-in-progress software system, etc.)**

- Test plans, test cases (include **unit test cases**), and test data that is sufficiently large enough to simulate the scale of the developed system. Details of unit testing procedures that have been conducted to clearly demonstrate (with sufficient evidence) that your group has followed test-driven development
- Sufficient evidence (with screenshots and detailed text description/explanation) to demonstrate the use of **CI/CD** in your project (i.e. the development and deployment of **at least** one feature/functionality).
- Identify and discuss **ethical considerations** in developing the software system in this project and how your team have addressed them.
- Identify a feature of your software application that can be developed using **data-driven software development**. Present a detailed plan of how this feature would be developed and integrated into your software application using the data-driven approach discussed in the subject.
- True group meeting records: agendas and meeting minutes which includes at least the following: meeting date, attendance, progress reports, review and tracking (e.g. snapshots of Gantt chart tracking or backlogs, etc.), discussion summaries, and action plans/items.
- **Member contribution for the whole project (with each member's signature):**
 - On the cover page of your progress/mid-project/final report, you need to provide **rating** for the contribution of each team member and a **detailed explanation of what the team member did for the project** to justify the rating (e.g. the roles that they filled, the tasks they completed, and the artefacts that they successfully delivered).
 - Everyone in the team should sign the cover page. The individual contribution of each team member is assessed by all the other members.
 - The rating scale can be a percentage number (e.g. 60%). Alternatively, the scale be in the form of “contributed”, “very little”, and “almost no contribution”. For a team member who has “contributed”, he/she will receive 100% of the group mark; for a team member who contributed “very little”, he/she will receive 50% of the team mark; for students who made “almost no contribution”, he/she will receive 0 marks for the entire group project. Your tutor/lecturer may make adjustment to this marking criterion based on practical situations.

A suggested plan:

- The first week: finalize group and start working on the project. Produce the first complete version of the requirements.
- One **iteration/sprint per week** until the end of project. In each iteration:
 - Design, implement, and test a number of functionalities;
 - **Demonstrate the working system to the clients (i.e. tutors) to receive feedback during the second half of weekly labs. Weekly progress will be observed and noted by the tutors and will contribute to the project management component of your project marks. Check the marking scheme in the last page for details.**
 - Continue eliciting and clarifying further requirements.

The project description is in the next page.

Project Description

Clarification
- Concurrency is not required, just make it 1 user at a time
- Customer cancel booking, no refund, no need to make seats available again
- Fields for booking just borrow from GV or something
- Have at least 2 or 3 sample data (e.g. Cinema, movie, session, staff account, customers, etc.)

Important Notes:

- This Project Description provides only the **high-level goals** of this project. The development team **MUST elicit more detailed and specific requirements AND get feedback from “the client”** (the tutor).
- The tutors will note your group’s progress and interaction with the “client” since they are one of the factors contributing to the final marks.
- The requirements may change during the course of the project (this is to simulate real-life projects).
- At least the backend/middleware of your software product (i.e. the main code that controls/runs all application logic and hold data in memory) needs to be **object oriented**.
- You need to form a group of **6-7 people** in your same lab ASAP and register your group with your tutor (see below):
 - Full time cohort: Terence Chew (tchew@uow.edu.au)
 - Part time cohort: Kheng Teck Tan (ktan@uow.edu.au)

In this project, your team is asked to design and develop a cinema ticket booking system.

The system should support **at least** the following key aspects.

1. Support and manage different types of users and user profiles and preferences (i.e. system admin, manager, staff, customer etc.). datatype
2. Support the management of cinema rooms, seats (e.g. seat capacity and seat map), and the allocation of movie sessions to cinema rooms.
3. Support the process of purchasing and issuing tickets for a movie session. This process should also include seat selection and allocation. Note that there are different kinds of tickets such as adult, child, student, senior, etc. Seat allocation can be automated based on user preferences. Customer can also pre-purchase food and drinks. optional to make it automated or if user account is required
4. Support the customers to submit their review and rating based on their experience at the cinema.
5. Support the management and process of gaining and redeeming loyalty points.
6. Generate different kind or relevant reports for cinema managers.

You must create test data that is sufficiently large enough to simulate the system (e.g. 100 records to each datatype). You could write a script to generate these data randomly. **In the final product demonstration, you will need to run a live demo of your product with these test data.**

The marking scheme is in the next page for your reference.

Actors (4):

- User Admin (in-charge of accounts)
- Cinema Owner (interested in reports)
- Customers (buy stuff)
- Manager/Staff (everything else)

Use case 1 - User admin

User account, profile

CRUD + S (search)

"Delete is changed to suspend, to simplify things"

10 cases, 5 CRUDS for account and 5 for profile

+ 1 for Login and 1 for Logout (12 in total)

User account = login account

User profile = role tagged to account

Use case 2 - Manager

- CRUDS for Cinema Room
(Delete change to suspend/not avail)
- CRUDS for Seats
- CRUDS for Movie Sessions

Use case 3 - Customer + Manager

Can be account or email tickets

CRUDS for Manager to deal with food and drinks

Use case 4 - Customer

Reviews to be anonymous or tagged to account

Use case 5 - Customer

Points awarded does not matter, as long as its a functional implemented feature

Use case 6 - Cinema Owner

Report related to hourly, weekly, daily, data of ticket sales (best selling)

Marking scheme

<i>Component</i>	<i>Out of</i>	<i>Marks</i>	<i>Comments</i>
Final Project Presentation (Recoded demo video + Q&A session)	5		
Final Deliverables			
Overall quality of the Final Deliverables	2		
User stories and tasks	8		
Analysis and Design (use cases, detailed design models, consistency between design models, consistency between design with code, etc.)	9		
Implementation (quality of code, functionalities implemented, sophistication of the solutions, consistency with design, etc.)	6		
Test-driven development	2		
CI/CD	2		
Ethical consideration and discussions	2		
Data-driven development	2		
Effective use of methodologies (e.g. evidence of the use of a methodology and tool support, true meeting records, weekly progress as observed and noted in the labs , etc.)	2		
Total	40
